

**HEMATOPOIETIC STEM CELL TRANSPLANTATION:  
UPDATING THE OLD CLOSET**

**RICHARD W. CHILDS M.D.  
BETHESDA MD**

# Learning Objectives

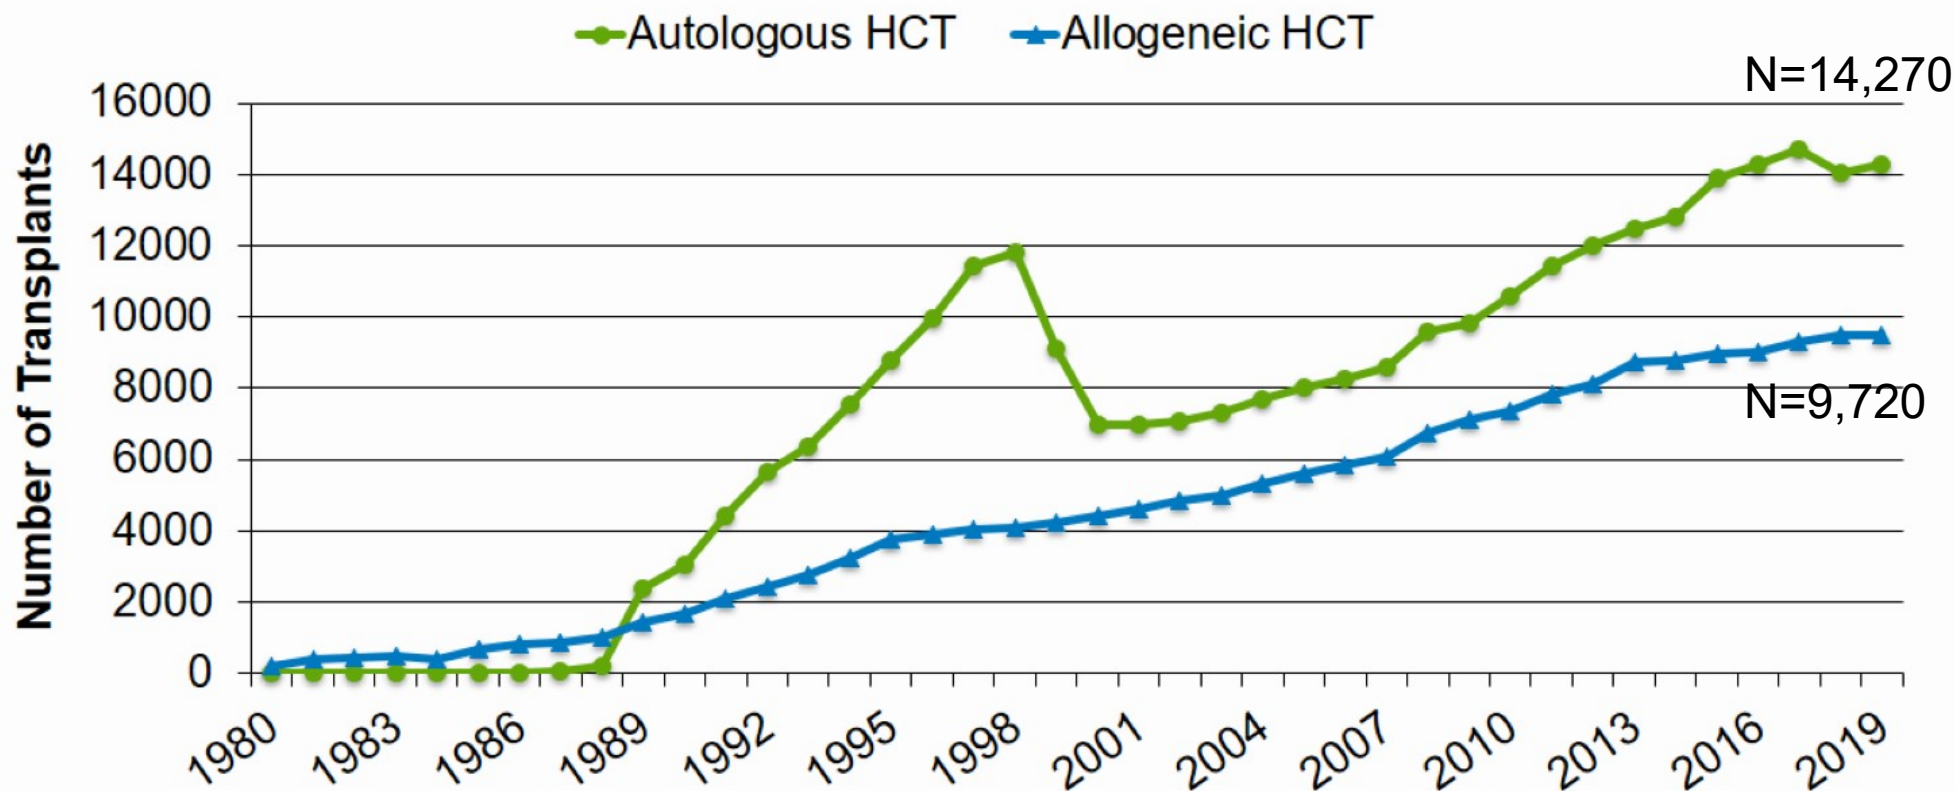

- **To review Allogeneic Transplants in 2021**
  - State of the art
  - Transplant types, outcomes and trends
- **To update the status of Haplo-transplants- Everything you need to know**
- **To review outcomes with Cord Blood transplants compared to Haplo Transplants- which is better**
  - CTN1101 tells us.....
- **To update strategies to prevent and treat GVHD:**
  - New transplant approaches to prevent acute GVHD
  - New approaches besides steroids for managing acute GVHD
  - New approaches to managing steroid refractory GVHD and chronic GVHD

GVHD= Graft vs host disease

## Dr. Richard W. Childs disclosures:

- None

## Estimated Annual Number of HCT Recipients in the US by Transplant Type

## Indications for Hematopoietic Cell Transplant in the US, 2019

# Major Improvements in Transplant Safety Over the Past 2 Decades

Day 200 NRM

2003-2007-n=1148  
2013-2017- n=1131

Outcomes after allogeneic HSCT improve over time  
(adjusted HRs compare 2013-2017 vs. 2003-2007)

Death After Transplant

At risk, n

1993-1997	1418	787	682	638	608	689
2003-2007	1148	755	662	618	594	565
2013-2017	1131	810	523	310	161	50

# Major Improvements in Transplant Outcomes Over the Past 2 Decades

- **First FDA approved drugs to treat GVHD**
  - **Ibrutinib** demonstrated ORR 67% cGVHD (CR=21%, PR=45%)
    - Miklos, D et al, Blood-Sept 2017
  - **Ruxolitinib** 73% response for SR acute GVHD- FDA approved May 24, 2019
- **Letermovir approved (2017) to prevent CMV reactivation post-HCT**
  - Reduced risk of CMV reactivation from 41% to 17% compared to placebo

## Trends in Allogeneic HCT in the US by Recipient Age^

^Transplants for AML, ALL, MDS, NHL, HD, MM

## Estimated Allogeneic HCT Recipients in the US by Donor Type

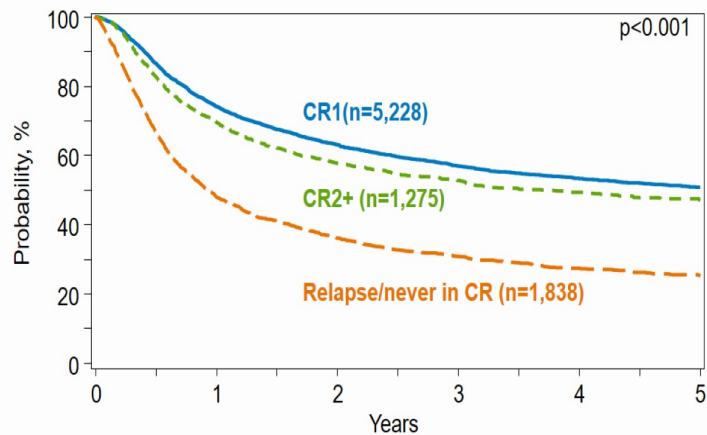

# Matched Related Donor Allogeneic HCT in the US in Patients $\geq 18$ Years

# Allogeneic Transplant For Hematological Malignancies: The Earlier the Better !!

Survival after Matched Related Donor HCT for Acute Myelogenous Leukemia (AML), Age  $\geq 18$  Years, in the US, 2008-2018

Trends in allogeneic HCT for Acute Myelogenous Leukemia (AML) by Disease Status in the US

Reduced transplant-related mortality and lower relapse with the earlier use of transplants has led to an increasing use of allogeneic transplants upfront for AML in CR-1

# Haplo-Transplants: Current Status and Trends

Post-Transplant Cyclophosphamide Has  
Revolutionized Haplo Transplants

# Most Haplo-Transplants Use Post Transplant Cytoxan

## Haploidentical HCT in the US by GVHD Prophylaxis

Abbreviations - PtCy: Post-transplant cyclophosphamide; CNI: calcineurin inhibitor

# Use Of Haplo-Transplants Increasing For Multiple Disease Categories

## Haploidentical HCT in the US by Disease

\*Not including aplastic anemia

# Slightly More RIC Haplo-Transplants Than Myeloablative Transplants

## Haploidentical HCT in the US by Conditioning Intensity

MAC: myeloablative conditioning, RIC: reduced intensity conditioning

# Haplo Transplants and Graft Source: More PBSC then BM With Similar Outcome

## Haplo-Transplants and Graft Source

## Haplo-Transplants and Graft Source and Survival

Bashey et al, JCO 2017

PBSC=Peripheral Blood Stem Cell

BM= Bone marrow

# Who IS the Optimal Donor To Choose For Haplo Transplants Relative

**Fact:** In transplants from HLA matched donors (related and unrelated), best outcomes are associated with

- Donors that have the best HLA match
- Donors who are younger (<30 years MUD)
- Avoiding a female donor into a male recipient (results in less GVHD)

**Fact:** Recipients of Haplo Transplants typically have many potential family donors to choose from

## **Choosing the best Donor:**

- PFS and survival not impacted by donor age, gender, relationship of the donor to the recipient, degree of HLA mismatch or ABO incompatibility, prior donor pregnancy
- These data support the concept that any haplo-identical family member can be used as a donor (avoiding DSA).

# Multivariate Analysis of Risk Factors for Acute Grade II-IV GVHD and Chronic GVHD After Haplo-transplant

## Study

- CIBMTR Study 646 pts between 2013-2016

## Results

- Acute GVHD not impacted by degree of HLA match, type of relative, female into male, CD3 dose, Type of conditioning or graft source (PB vs BM)
- Donor age >29 years associated with more acute GVHD- so chose haplo-donors under 29 if possible
- Peripheral Blood RIC associated with more cGVHD

## Donor Age

- G2-4: 30-49 v <29
  - (HR 1.53, CI 1.11-2.12,
  - P=0.01)
- G3-4: 50 v <29
  - (HR 3.89, CI 1.81-8.35,
  - P = 0.0005)

# Cord vs Haplo: Which is Better?

## Pros for Both Cords and Haplo Transplants

- Almost all Adults will have a haplo donor available or a cord unit that is suitable for transplantation.
- Acute and chronic GVHD rates are very low with both approaches

## Cons For Cords:

- Cost approx. \$50,000 per graft
- Slow engraftment rates
- 15% graft failure rate
- Delayed recovery in T-cell immunity=  
viral complications

## Cons for Haplos:

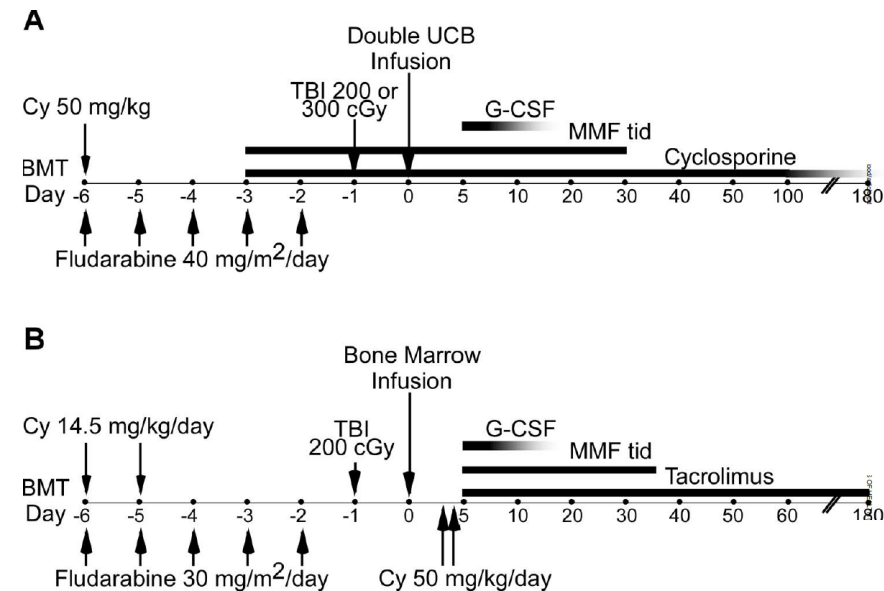

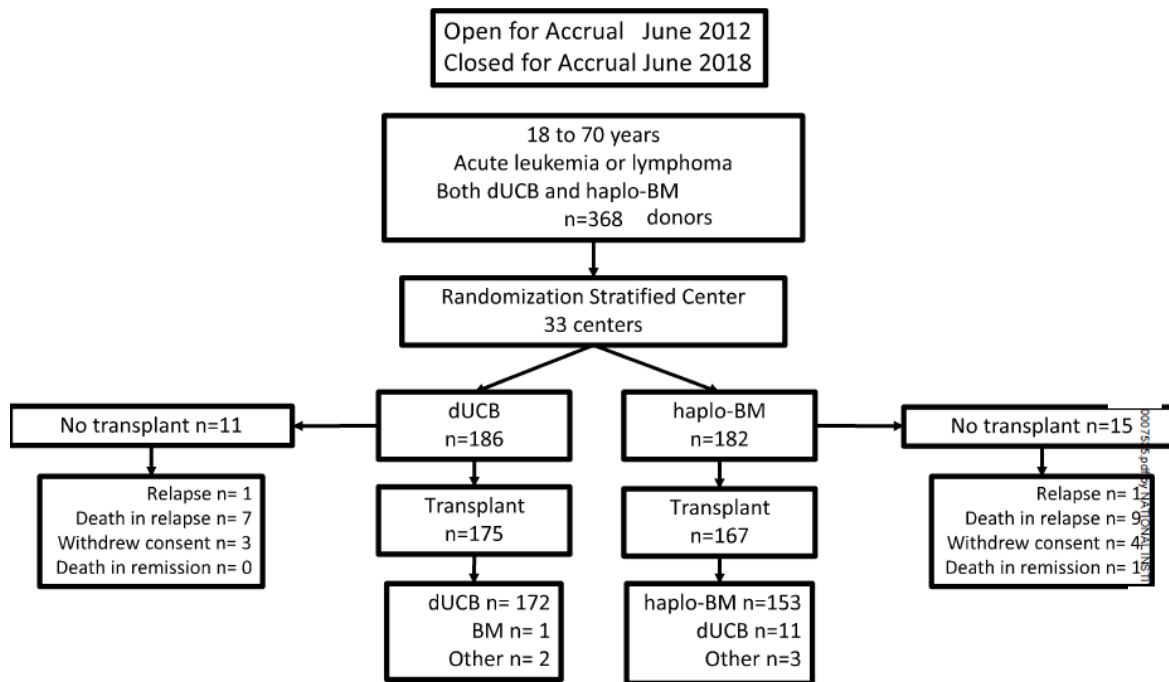

- Relapse rate may be higher??
- Graft rejection problematic for some diseases

# CTN 1101: Cord vs. Haplo

## Study:

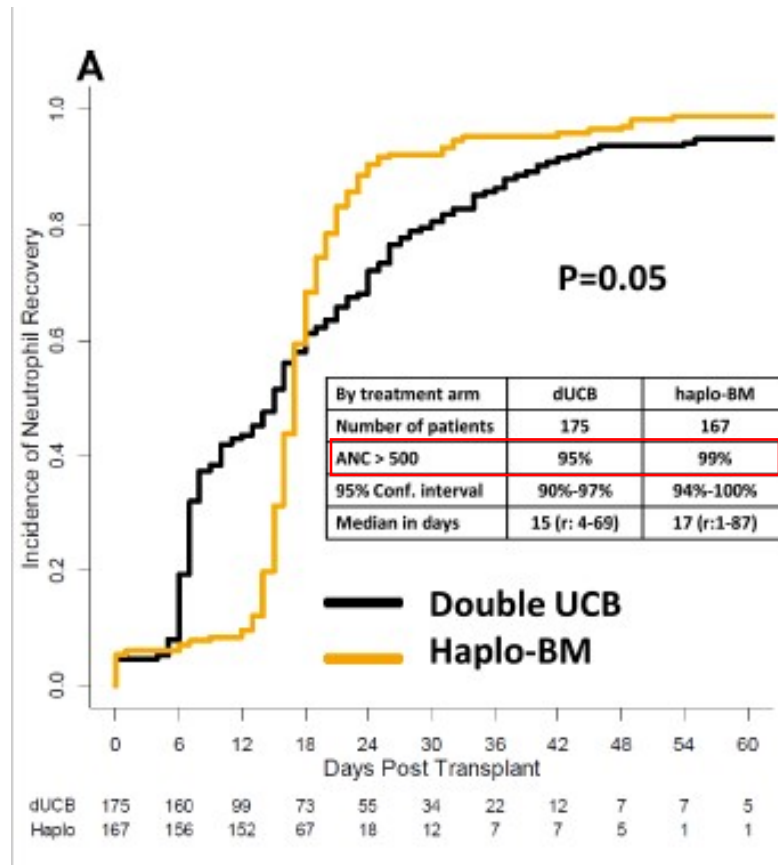

- June 2012- through June 2018
- 368 pts randomized to dual cord transplant vs haplo-Cy transplant using RIC
- Age 18-70 years
- Diseases: acute leukemia in remission or chemotherapy sensitive lymphomas

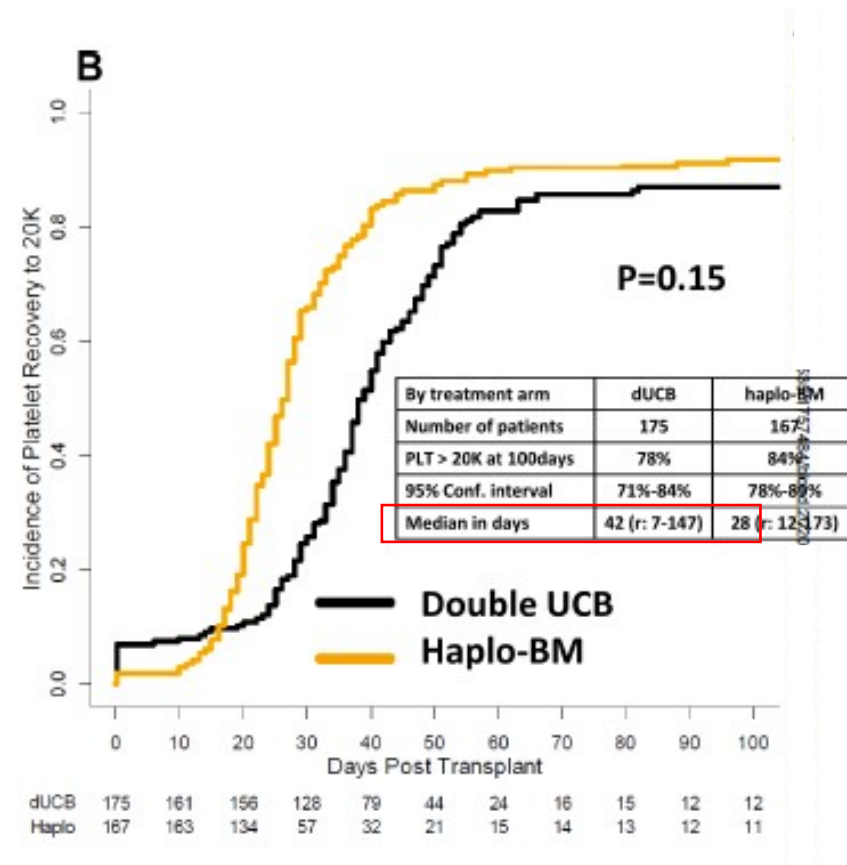

# CTN 1101: Cord vs. Haplo

## Neutrophil Recovery

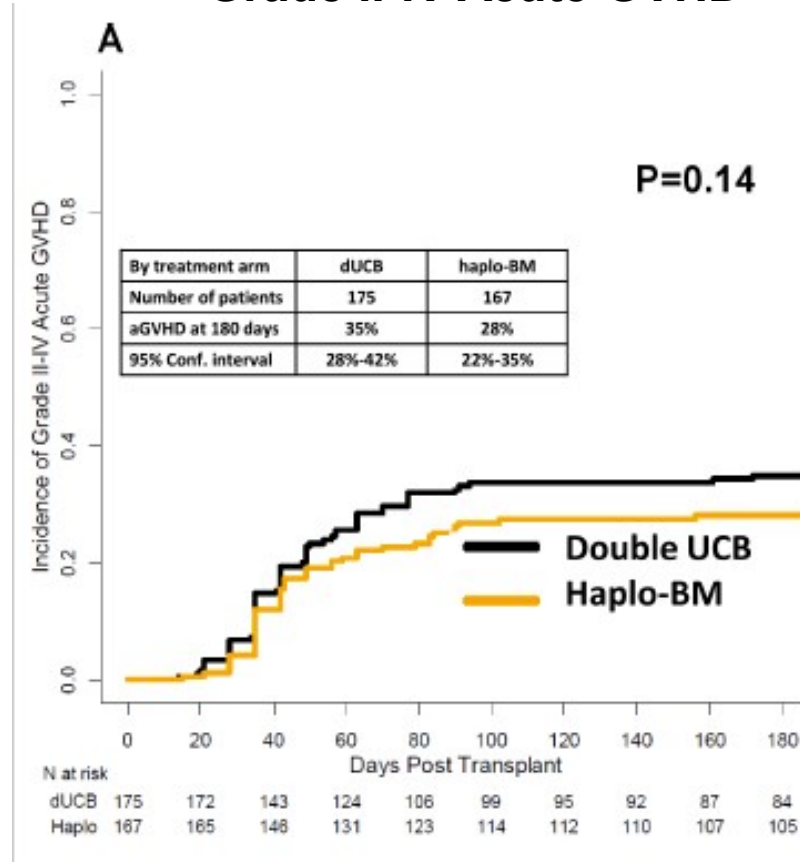

## Platelet Recovery

# CTN 1101: Cord vs. Haplo

## Grade II-IV Acute GVHD

## Chronic GVHD

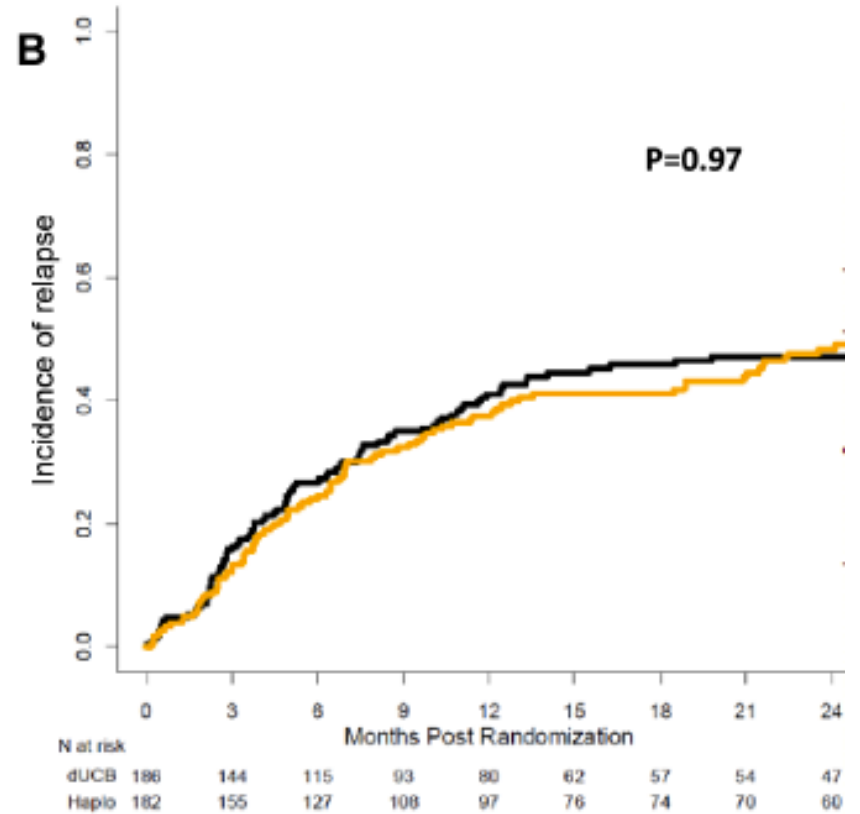

# CTN 1101: Cord vs. Haplo

## Progression Free Survival

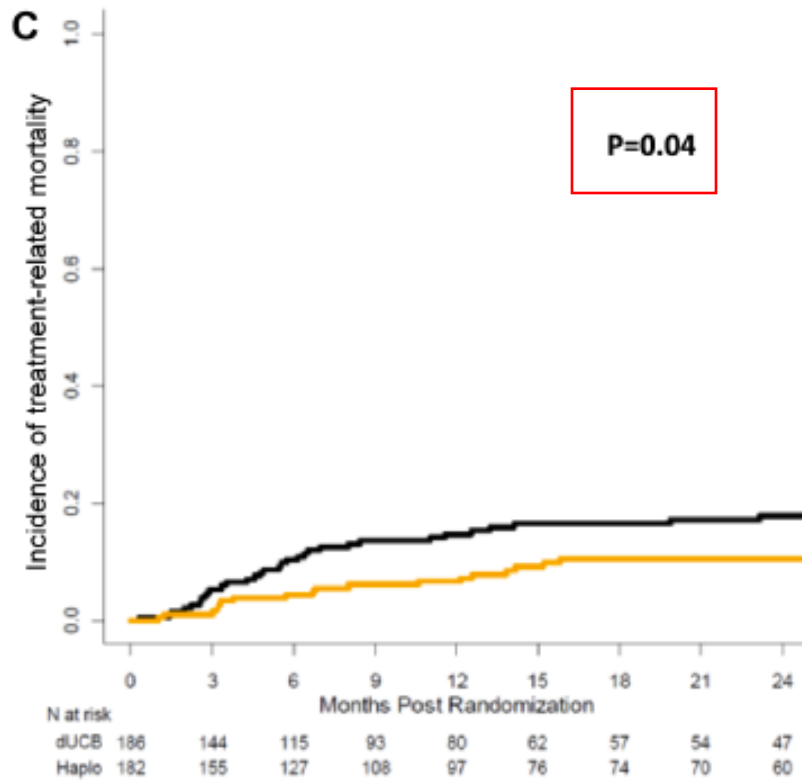

## Relapse

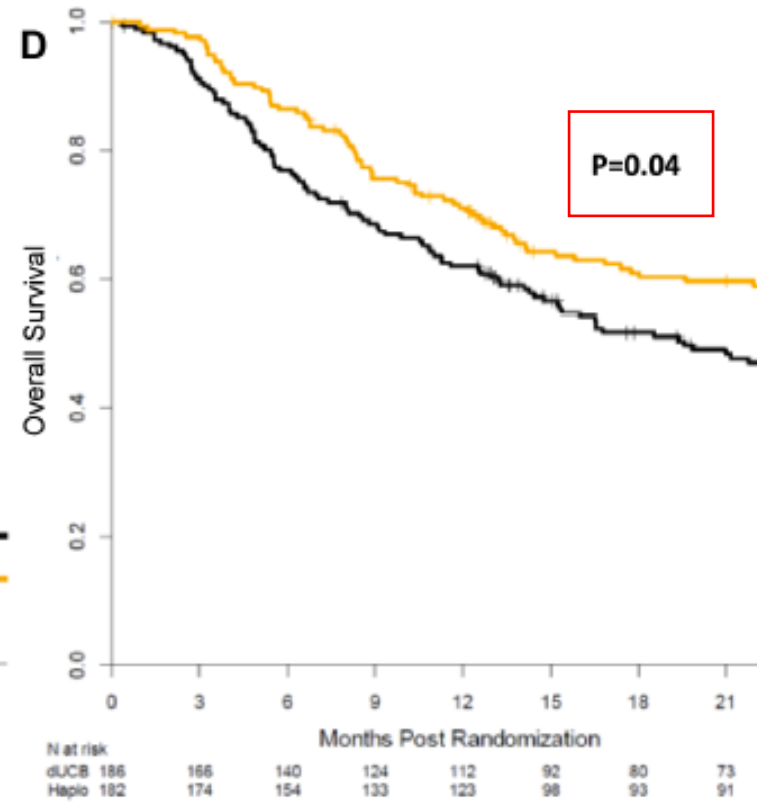

# CTN 1101: Cord vs. Haplo

## Transplant related Mortality

## Overall Survival

# CTN 1101: Cord vs. Haplo

## Conclusions:

- There was no significant difference in progression-free survival between cord blood and haploidentical transplantation for leukemia or lymphoma
- Engraftment rates and relapse were similar between transplant approaches
- Haplo transplants had lower non-relapse mortality rates which resulted in superior overall survival
- These data favor the use of haploidentical marrow over cord blood transplantation

# GVHD Historically Has Been A Major Contributor to Transplant Related Mortality

## Acute GVHD

1. GI Tract: Diarrhea
2. Liver: Jaundice
3. Skin: Rash

**GVHD of the Colon**

Pictures from the files  
of Dr. Richard Childs

# GVHD Historically Has Been A Major Contributor to Transplant Related Mortality

- Primary Disease
- GVHD
- Organ Failure
- Other
- Graft Rejection
- Infection
- Hemorrhage
- Unknown

13% caused by GVHD

CIBMTR Data 2021

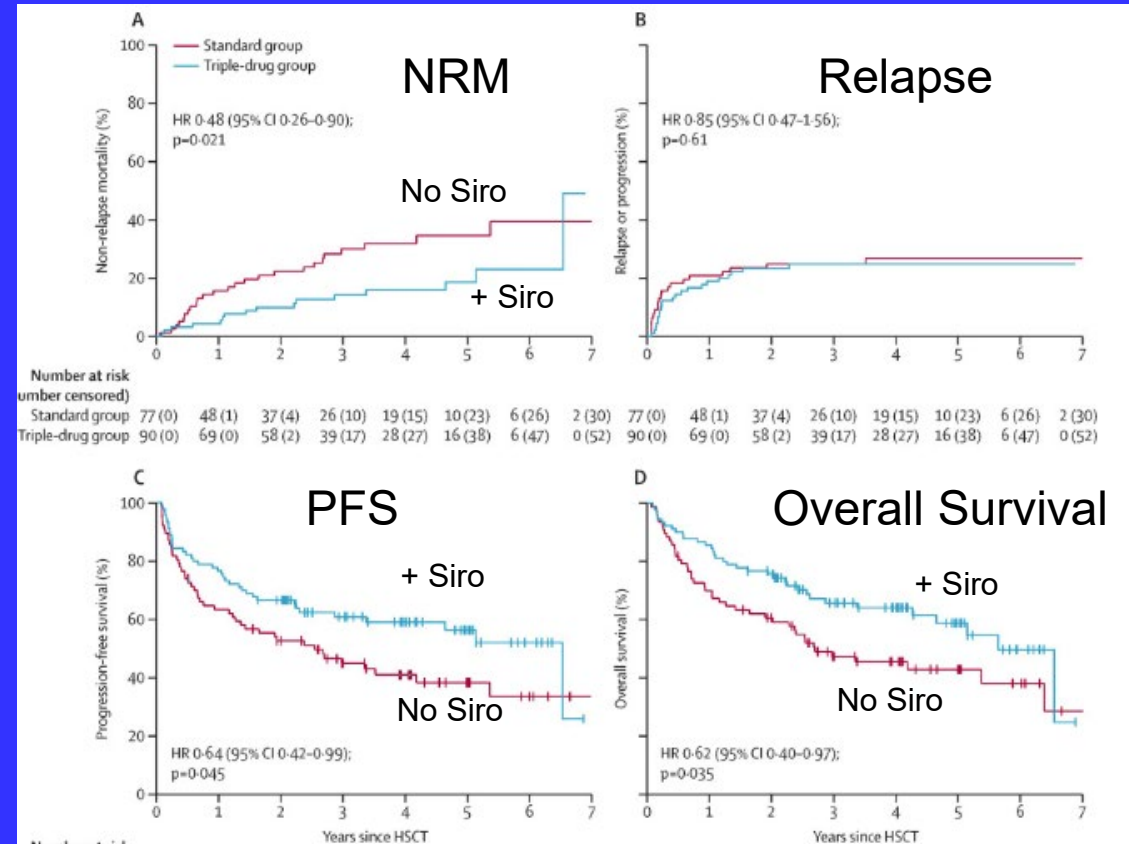

GVHD of the Colon

# Prevention of GVHD: Adding Sirolimus to Standard CSA/MMF Reduces GVHD and Improves Survival After RIC Allo HCT

## Post-Transplant Cytoxin resulted in

1. Lower grade III-IV GVHD (9% vs 19%;  $P < 0.04$ )
2. Trend towards less NRM (16% vs 29%;  $p = 0.06$ )
3. Improved LFS (55% vs 34%;  $p < 0.05$ )
4. Trend towards improved OS (56% vs 38%;  $p = 0.07$ )
5. Improved GVHD free/Relapse free survival (37% vs 21%;  $p < 0.03$ )

# Treatment of Acute And Chronic GVHD: Steroids Represent Mainstay of Therapy

## Pros:

- Rapid onset of action: <24 hours

## Cons:

- Only 50%-70% Response Rate
- Substantial morbidity related to use
  - Opportunistic infection: Lethal fungal infections
  - Hypertension
  - Diabetes
  - Osteopenia
  - Cataracts
  - Myalgia

**Hypothesis** -pts presenting with acute GVHD can be effectively treated with sirolimus as opposed to steroids: **CTN BMT 1501**

# BMT CTN 1501 Trial

## Study Design:

- Patients: standard-risk acute GVHD
- Intervention:
  - Study Drug: sirolimus (goal 10-14 ng/mL until GVHD resolution, then 5-10 ng/mL after resolution until day 56), followed by taper x less than 3 months. Can have concurrent calcineurin inhibitors.
  - Control: prednisone 2 mg/kg/day, required to be on for at least 3 days, followed by taper. Suggested taper x 7 weeks.
- Objectives:
  - Primary endpoint: difference between day 28 CR/PR rates in aGVHD
  - Secondary endpoints: the rate of day 28 CR/PR with prednisone dose 0.25 mg/kg/day or less (treatment failure rate), chronic GVHD incidence, infection, EFS, relapse, death, DFS and OS, NRM
- Target sample size: 120, to achieve a 90% confidence interval (CI) half width of 15% for the difference in day 28 CR/PR rates between groups

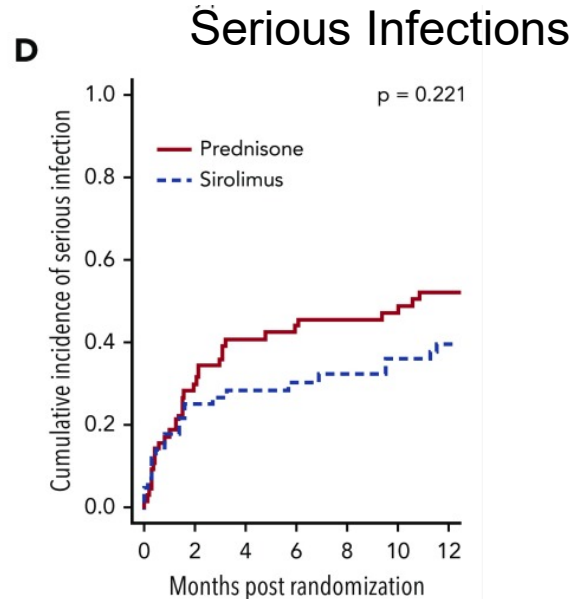

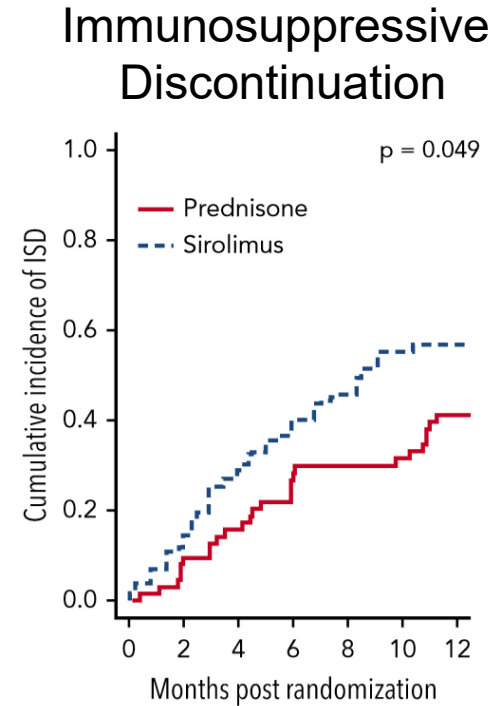

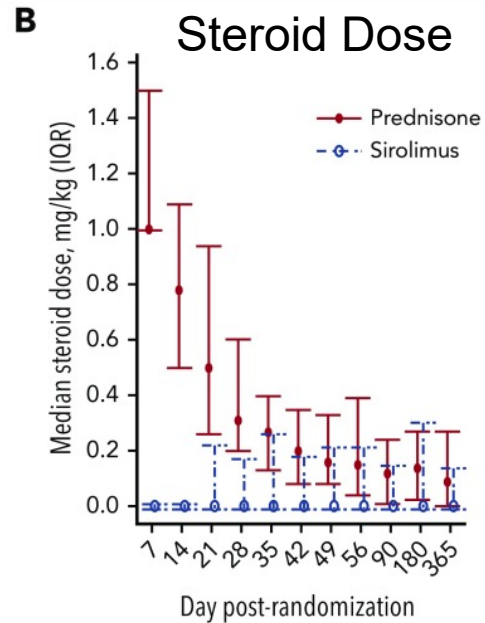

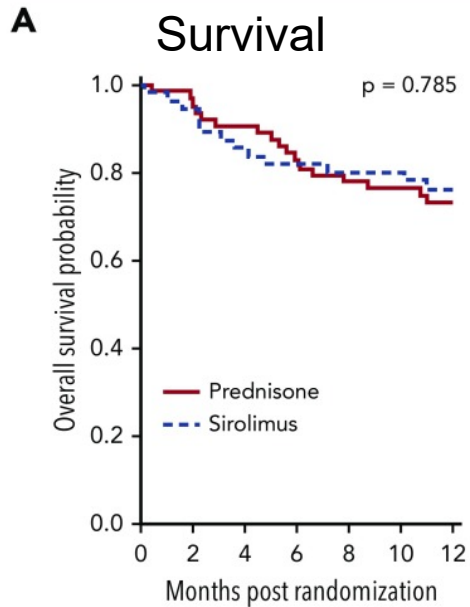

# BMT CTN 1501 Trial

## RESULTS:

- Day 28 CR rates for sirolimus vs prednisone similar
- Day 28 CR rates for sirolimus vs < 0.25 mg/kg higher with sirolimus
- Day 56- Nonresponse was significantly higher in the sirolimus group
  - 84% of Sirolimus non-responders salvaged with steroids

### Sirolimus

- is a viable option for front-line treatment of acute GVHD
- Non-responders can be salvaged with steroids
- Associated with quicker complete discontinuation of immunosuppressants and better quality of life
- Phase III study indicated

CLINICAL TRIALS AND OBSERVATIONS

# Ruxolitinib for the treatment of steroid-refractory acute GVHD (REACH1): a multicenter, open-label phase 2 trial

Madan Jagasia,<sup>1</sup> Miguel-Angel Perales,<sup>2,3</sup> Mark A. Schroeder,<sup>4</sup> Haris Ali,<sup>5</sup> Nirav N. Shah,<sup>6</sup> Yi-Bin Chen,<sup>7</sup> Salman Fazal,<sup>8</sup> Fitzroy W. Dawkins,<sup>9</sup> Michael C. Abubakar,<sup>9</sup> Chuan-Ting Ho,<sup>10</sup> Louis Cornejo-Sanchez,<sup>10,11</sup> Michael D. Huxford,<sup>12</sup> and H. Jay Kim,<sup>12</sup> on behalf of the REACH1 Study

## Overall response

Day 28 overall response rate: 54.9%

- 26.8% complete response
- 9.9% very good partial response
- 18.3% partial response

Overall response rate at any time: 73.2%

Duration of response at 6 months: median, 345 days

blood

### CLINICAL TRIALS AND OBSERVATIONS

## Ruxolitinib for the treatment of steroid-refractory acute GVHD (REACH1): a multicenter, open-label phase 2 trial

Madan Jagasia,<sup>1</sup> Miguel-Angel Perales,<sup>2,3</sup> Mark A. Schroeder,<sup>4</sup> Haris Ali,<sup>5</sup> Nirav N. Shah,<sup>6</sup> Yi-Bin Chen,<sup>7</sup> Salman Fazal,<sup>8</sup> Fitzroy W. Dawkins,<sup>9</sup> Michael C. Abuskitter,<sup>9</sup> Chun-Ting,<sup>9</sup> Laura Connolly-Smith,<sup>10,11</sup> Michael D. Howell,<sup>9</sup> and H. Jess Khoury,<sup>12</sup> on behalf of the REACH1 Study

### Conclusions:

- Ruxolitinib is an effective treatment option for patients with steroid-refractory aGVHD.
- Responses to ruxolitinib seen at day 28 were durable and were associated with improved survival when compared with survival rates among non-responders
- Ongoing REACH2 phase 3 randomized study of ruxolitinib vs best available therapy in patients with steroid-refractory aGVHD (NCT02913261) will further establish the role of JAK inhibitors in the treatment of steroid-refractory aGVHD
